

SaaS Integration Hub

Mock RFP Response — github.com/him-agni/saas_integration_hub

Written as a practice exercise: technical answers a Solutions Engineer would give during a buyer evaluation, based on the architecture actually implemented in this project.

Q: How does your platform verify that incoming webhook events (e.g., from Stripe or Shopify) are authentic and haven't been tampered with?

A: Every inbound webhook is validated using HMAC-SHA256 signature verification against the raw request body before any processing occurs. Requests that fail verification are rejected outright and never reach business logic, so a spoofed event can't trigger a false action, like a fraudulent payment triggering a shipment.

Q: What happens if the same webhook event is delivered more than once? Stripe, for example, guarantees 'at least once' delivery.

A: The platform enforces idempotency using a unique index on the provider's event ID. A duplicate delivery — from a retry after a timeout or network issue — is silently ignored rather than reprocessed, so customers never see duplicate emails, duplicate Slack alerts, or duplicate CRM records.

Q: If one of our downstream systems, like our CRM, goes down, does that affect the rest of the integration?

A: No. Each downstream action — Slack alert, email notification, CRM sync — is handled independently. A failure in one doesn't block or delay the others, so an outage on one vendor's side doesn't take down your entire notification pipeline.

Q: Can we test the integration without connecting our live payment or inventory systems?

A: Yes. A built-in event simulator can trigger realistic payment, inventory, and delivery scenarios on demand, so your team can validate the full pipeline end-to-end before ever connecting a live system.

Q: What visibility do we get into what the integration is actually doing day to day?

A: A live dashboard shows every processed event with its source, type, and downstream delivery status, refreshing automatically. Events are filterable and searchable by source, type, or status, so support and ops teams can self-serve most 'did this go through' questions without opening a ticket.

Q: Do you provide documentation our engineering team can use to integrate independently, without needing you on every call?

A: Yes — a setup guide, a webhook-verification guide, a full API reference, and an importable Postman collection covering every endpoint are included, so your team can get to a working integration on their own timeline.
