

SaaS Integration Hub

Solution Brief — github.com/him-agni/saas_integration_hub

Problem: Commerce teams have payment, inventory, and delivery events scattered across Stripe, Shopify, and internal tools, with no single reliable pipeline turning those events into the right downstream action — alerting ops, notifying customers, or updating a CRM record.

Solution: One verified, idempotent event pipeline that normalizes events from multiple sources and reliably fans them out to Slack, email, and CRM, backed by a live dashboard for visibility and a simulator for safe testing.

How It Works: Stripe / Shopify / Simulator -> signature verification -> event normalization -> MongoDB event store -> parallel fanout to Slack, email, and HubSpot -> React dashboard polling every 5 seconds.

Key Capabilities

- HMAC-SHA256 signature verification on every inbound webhook
- Idempotent processing — duplicate deliveries are ignored, not reprocessed
- Independent per-channel fanout, so one vendor outage doesn't block the others
- Built-in event simulator for demos and testing without live systems
- Searchable, filterable live event log
- Full docs and an importable Postman collection for self-serve integration

Business Outcome: Fewer missed or duplicate customer notifications, faster onboarding for engineering teams thanks to ready-made docs and a Postman collection, and one operational view instead of checking multiple vendor dashboards.

Tech Stack: React 18, Vite, Tailwind CSS, TanStack Query, Node.js, Express, MongoDB, Stripe, Shopify, Slack, Resend, HubSpot.
