

Lead & Form Automation Hub

MEDDIC Breakdown — github.com/him-agni/lead-form-automation-hub

Self-directed practice: treating this project as a product under evaluation by a realistic buyer, to build fluency in sales qualification language used in Solutions Engineering.

M Metrics	Reduce lost inbound leads to near zero; reduce time from form submission to first team response; cut hours of weekly manual reconciliation between form tool, CRM, and team chat.
E Economic Buyer	Head of Marketing Operations or RevOps Director — owns budget for lead-routing and marketing-automation tooling.
D Decision Criteria	Reliability under a downstream vendor outage, ability to add or swap destinations without a rewrite, a clear per-submission audit trail, and setup lift low enough for a marketing ops team to run without engineering.
D Decision Process	Marketing ops runs a pilot on one active form, validates that no leads are lost across simulated Discord and Airtable outages, then rolls the pattern out to additional forms and destinations.
I Identify Pain	The team currently runs a fragile Zapier chain from Tally into Airtable, Discord, and Sheets. When one step fails, the others still succeed silently, so hot leads slip through and only surface days later during a manual audit.
C Champion	The marketing ops manager who owns and constantly babysits the current Zapier chain and wants a reliable pipeline they don't have to check every morning.
