

SaaS Integration Hub

MEDDIC Breakdown — github.com/him-agni/saas_integration_hub

Self-directed practice: treating this project as a product under evaluation by a realistic buyer, to build fluency in sales qualification language used in Solutions Engineering.

M Metrics	Reduce time spent manually reconciling payment/inventory mismatches; reduce missed or duplicate customer notifications to near zero; cut new-integration onboarding time for engineering teams.
E Economic Buyer	VP of Operations or Head of Commerce Platform — owns budget for tooling that reduces manual ops overhead.
D Decision Criteria	Reliability under webhook retries, ability to add new downstream systems without a rebuild, a clear audit trail of every event, and low integration lift for their engineering team.
D Decision Process	Technical evaluation by an engineering lead, a live demo/POC run against sample events, a security review of webhook handling, then procurement sign-off.
I Identify Pain	Ops currently checks three separate vendor dashboards to answer 'did this order actually notify the customer,' and duplicate Slack alerts from webhook retries have eroded trust in the alerting.
C Champion	The engineering lead who owns the current fragile webhook handling and wants something more reliable without a large rebuild.
